1. INTRODUCTION

Healthcare systems and coverage decisions for medical innovations and services are complex systems, relying on multiple technologies in the management of medical health care systems in different settings (under local constraints on medical spending). In the U.S., the National Center for Health and Clinical Excellence (NICE) is charged with the difficult task of assessing the value of health technologies, and making recommendations that guide health coverage decisions. In the U.S., the National Center for Health and Clinical Excellence (NICE) is charged with the difficult task of assessing the value of health technologies, and making recommendations that guide health coverage decisions. In the U.S., the National Center for Health and Clinical Excellence (NICE) is charged with the difficult task of assessing the value of health technologies, and making recommendations that guide health coverage decisions.

Future Process: Benefits

1. One click update + transcription error reduction.
2. Speed of model creation (hence R not C++, time is money)!
3. Computational power (Rcpp) - VOI, analysis.
4. Code/data separation, testing independent of data.
5. Transparency - especially where publicly funded.
6. Reach & replication, one worldwide model on remote server.
7. Stakeholder engagement - Shiny + expert elicitation.

Abstract

Health economic evaluation models have traditionally been built in Microsoft Excel, but more sophisticated tools are increasingly being used as model complexity and computational requirements increase. Of all the programming languages, R is most popular amongst health economists because it has a plethora of user created packages and is highly flexible. However, even with an integrated development environment such as R Studio, R lacks a simple point and click user interface and therefore requires some programming ability. This might make the switch from Microsoft Excel to R seem daunting, and it might make it difficult to directly communicate results with decisions makers and other stakeholders.

The R package Shiny has the potential to resolve this limitation. It allows programmers to embed health economic models developed in R into interactive web browser based user interfaces. Users can specify their own assumptions about model parameters and run different scenario analyses, which, in the case of regular a Markov model, can be computed within seconds. This paper provides a tutorial on how to wrap a health economic model built in R into a Shiny application. We use a four-state Markov model developed by the Decision Analysis in R for Technologies in Health (DARTH) group as a case-study to demonstrate main principles and basic functionality.

A more extensive tutorial, all code, and data are provided in a [GitHub repository](#).

Treatment Cost

PSA runs

Initial age

UI code

```
ui <- fluidPage (      # creates empty page
```

```
# title of app
```

```
titlePanel("Sick Sicker Model in Shiny"),
```

```
# layout is a sidebar-layout
```

```
sidebarLayout(
```

```
# open sidebar panel
```

```
< SIDEBAR PANEL CODE >
```

```
# open main panel
```

```
< MAIN PANEL CODE >
```

```
) # close sidebarlayout
```

```
) # close UI fluidpage
```

Sick Sicker Model in Shiny

The sidebar panel contains three input controls: a numeric input for 'Treatment Cost' set to 200, a numeric input for 'PSA runs' set to 1000, and a slider for 'initial age' ranging from 10 to 80 with a current value of 25. A 'Run / update model' button is located at the bottom.

Results Table

Option	QALYs	Costs	Inc.QALYs	Inc.Costs	ICER
Treatment	18.59	100441.67	0.62	1406.24	2324.54
No Treatment	17.97	99035.43	NA	NA	NA

Cost-effectiveness Plane

Sidebar Panel Code

```
sidebarPanel( # open sidebar panel

  numericInput(inputId = "SI_c_Trt",
    label = "Treatment Cost",
    value = 200,
    min = 0,
    max = 400),

  numericInput(inputId = "SI_n_sim",
    label = "PSA runs",
    value = 1000,
    min = 0,
    max = 400),

  sliderInput(inputId = "SI_n_age_init",
    label = "Initial Age",
    value = 25,
    min = 10,
    max = 80),

  # action button runs model when pressed
  actionButton(inputId = "run_model",
    label = "Run model")

) # close sidebarPanel
```

The screenshot shows a sidebar panel with three input controls and an action button. The first control is a text input labeled "Treatment Cost" with a value of 200. The second is another text input labeled "PSA runs" with a value of 1000. The third is a slider input labeled "initial age" with a range from 10 to 80 and a current value of 25. Below these inputs is a button labeled "Run / update model".

Main Panel Code

```
mainPanel(  
  
# heading (results table)  
  h3("Results Table"),  
  
# tableOutput id = icer_table, from server  
  tableOutput(outputId = "SO_icer_table"),  
  
# heading (Cost effectiveness plane)  
  h3("Cost-effectiveness Plane"),  
  
# plotOutput id = SO_CE_plane, from server  
  plotOutput(outputId = "SO_CE_plane")  
  
) # close mainpanel
```

Results Table

Option	QALYs	Costs	Inc.QALYs	Inc.Costs	ICER
Treatment	18.61	101016.42	0.62	1412.82	2335.56
No Treatment	17.99	99603.60	NA	NA	NA

Cost-effectiveness Plane

Server Code

```
server <- function(input, output){

  observeEvent(input$run_model, # WHEN ACTION BUTTON PRESSED
    ignoreNULL = F, {

    # Run model function with Shiny inputs
    df_model_res = f_wrapper(c_Trt = input$SI_c_Trt,
                             n_age_init = input$SI_n_age_init,
                             n_sim = input$SI_n_sim)

    #— CREATE COST EFFECTIVENESS TABLE —#
    # renderTable continuously updates table
    output$SO_icer_table <- renderTable({ < ICER TABLE FUNCTION > }) # table plot end.

    #— CREATE COST EFFECTIVENESS PLANE —#
    # render plot repeatedly updates.
    output$SO_CE_plane <- renderPlot({ < CE PLANE FUNCTION > }) # renderplot end

  }) # Observe event end

} # Server end
```
